

SIMPLIFIED OFFLINE ASSET MANAGEMENT

Statistically 60% of large companies do not proactively manage offline IT assets. An organization's IT infrastructure is one of the biggest investments made and the most critical components to staying in business for companies of all sizes.

Proper offline IT Asset Management is a critical function for any organization and the reality is that less than 40% of organizations have implemented any type of ITAM program.

- ✓ Proactive, holistic management of IT Assets
- ✓ 'Aegis Asset Protect' - proprietary SaaS platform that actively tracks hardware lifecycles and plans for decommissioning and retirement

PROGRAM OVERVIEW

Aegis Asset Protect, our SaaS Asset Management platform is a cloud based IT asset tracking solution designed for businesses of all sizes. By simplifying common operations like adding assets, updating asset detail, and planning for future needs, it allows busy IT professionals to gain control of the assets in their organization while keeping up with other projects.

Repository: Register, manage and report on all IT assets in one central application. Search through your **online** and **offline** assets by any attribute at any time. Have a complete history of actions performed on an asset from cradle to grave.

Customizable: Almost every field in **Aegis Asset Protect** is free form because we don't want to force you to manage your assets a certain way or change your preferred way of tracking. This allows you to get started within minutes and implement your own processes along the way.

Simple: Common asset management tasks are made as simple as possible so you can spend time doing other things. Add assets in different ways like scanning an asset tag or importing a spreadsheet. Update assets as they move throughout the enterprise and change statuses.

Plan with Accuracy: Not only can you retrieve information on your current resources quickly, you can also plan effectively for resources and budget needed in upcoming years. Don't worry about overspending or wasting resources when you use **Aegis Asset Protect**.

Offline Asset Management: Once you have a clear understanding of where your **online** assets are located and who owns them, you can start automating **offline** asset activity. Create standard operating procedures for how assets behave during workflows like onboarding or disposition to ensure offline assets are managed properly and reach their final destination.
